

Mobile Television – watch DTT from anywhere in the house!

Watch DTT on your Mac or PC via a LAN or WiFi connection with Elgato’s newly launched EyeTV Netstream DTT, a dual TV tuner with integrated DiBcom technology

Elgato and DiBcom are pooling their expertise and today are launching the EyeTV Netstream DTT, a dual DTT TV tuner equipped with a DiBcom chip, which provides optimal digital TV reception for your home through your network router.

TV throughout your home network!

EyeTV Netstream DTT is a dual TV receiver for any Macs or PCs on your home network. It enables two users to watch and record different programmes simultaneously. It connects directly to your TV aerial and network router/switch and streams digital TV (DTT/DVB-T/Freeview) to computers on your network. Because there is no need to install it near a computer, you can position the device wherever you like.

Programmes for everyone!

The device enables you to watch live or pre-recorded TV and record both. You can subscribe to televised serials, delete content you don’t want and enjoy your favourite programmes on your iPod, iPhone or Apple TV. If you have a wireless network, you can watch TV on a laptop free of cables and in high definition, if this service is available.

Software for Macs and Windows

EyeTV Netstream DTT is supplied with EyeTV 3, Elgato’s TV software for Macs, and works with Windows 7 Media Center. The software for Windows which supports many of the same features offered by EyeTV 3 is also offered in the package.

About DiBcom

DiBcom is a fabless semiconductor company that designs and sells high-performance chipsets which enable low-energy mobile and portable TV reception at speeds exceeding 200 km/h. The company's solutions are used to receive television and radio in vehicles, and on decoders, PCs, mobile phones and other handheld multimedia devices. DiBcom has extensive experience in solving digital terrestrial radio and television reception problems and has overcome major technological barriers to provide a high-quality service. The company has developed a number of patented algorithms and architectures for fast and accurate channel estimation and high Doppler compensation for mobile use. Its chipsets are compliant with the current international digital video broadcast standards DVB-T, DVB-H, DVB-SH, T-DMB, ISDB-T and CMMB, and the digital radio broadcast standards DAB, DAB+ and T-DMB.
